Overview and Data Dictionary

Documentation Version: 3.0

Last updated: 10/06/2022

Dataset Overview

Description

This dataset describes the number and density of health care services in each census tract in the United States. The data includes counts, per capita densities, and area densities per tract for many types of businesses in the health care sector, including doctors, dentists, mental health providers, nursing homes, and pharmacies.

Principal Investigators

- Anam Khan, University of Michigan Institute for Social Research
- Mao Li, University of Michigan Institute for Social Research
- Jessica Finlay, University of Michigan Institute for Social Research
- Michael Esposito, University of Michigan Institute for Social Research
- Iris Gomez-Lopez, University of Michigan Institute for Social Research
- Philippa Clarke, University of Michigan Institute for Social Research
- Megan Chenoweth, University of Michigan Institute for Social Research

Funding Sources

- United States Department of Health and Human Services. Administration for Community Living. National Institute on Disability, Independent Living, and Rehabilitation Research (90RTHF0001)
- United States Department of Health and Human Services. National Institutes of Health. National Institute on Aging (RF1-AG-057540)

Data Sources

The North American Industry Classification System (NAICS) was used to identify organizations that can be considered health care services. NAICS was developed by the United States Office of Management and Budget and is “the standard used by Federal statistical agencies in classifying business establishments for the purpose of collecting, analyzing, and publishing statistical data related to the U.S. business economy” (United States Census Bureau, 2017).

Establishment data was taken from the National Establishment Time Series (NETS) database, which provides annual records of the US economy for more than 60 million private for-profit and nonprofit establishments and government agencies (Walls & Associates, 2017). This longitudinal data source classifies establishments by NAICS code and provides detailed business microdata and address history. NETS is produced in most years by Walls and Associates using archival establishment data from Dun & Bradstreet. While it currently includes data from 1990 to 2015 and 2017, only data from 2003-2015 and 2017 were used to create this dataset. (NETS data was not produced for 2016.)

Census tracts for establishments were determined using the 2010 TIGER/Line shapefiles produced by the United States Census Bureau (United States Census Bureau, 2010).

Census tract population figures for 2000-2010 were taken from Neighborhood Socioeconomic and Demographic Characteristics of Census Tracts, United States, 2000-2010 (Clarke & Melendez, 2019). Population figures for 2011-2017 were obtained from Socioeconomic Status and Demographic Characteristics of Census Tracts, United States, 2008-2017 (Melendez et al., 2020).

Coverage

The dataset contains one observation per census tract per year in the United States, Puerto Rico, and the US Virgin Islands. Other US island territories are excluded.

Methodology

Access to health care is an important component of maintaining individual and community health. However, the geographic distribution of health care providers and services is not equitable. Prior research has found a relationship between distance to health care providers,

utilization of health services (Hiscock et al., 2008), and disease detection (Khan et al., 2018). Other studies have shown that a shortage of health professionals in a geographic area is associated with worse general health status (Liu, 2007). Other neighborhood characteristics such as socioeconomic status also affect distribution and utilization of health care resources. Previous work has identified variations in the kinds of health care services utilized by residents in high- versus low-SES neighborhoods (Hussein et al., 2016, Huang et al., 2018). This dataset provides users with information on the number and density of different types of health care services across census tracts in the United States. This information can be used to build on existing health services research.

Our research team identified the following NAICS codes as representing health care providers and establishments:

- 621: all ambulatory health care services, whether provided independently or within a clinic or medical center.
- 6211: all physicians, i.e. those holding an M.D. (doctor of medicine) or D.O. (doctor of osteopathy) degree.
- 621111: physicians (except mental health), including general/internal medicine practitioners and specialists such as pediatricians, obstetrician/gynecologists, ophthalmologists, and allergists.
- 621112: mental health physicians, such as psychiatrists and psychotherapists with medical degrees (but excluding those without a medical degree such as psychologists and counselors).
- 6212: dentists, i.e. those holding a D.D.S. (doctor of dental surgery), D.M.D. (doctor of dental medicine), or D.D.Sc. (doctor of dental science) degree, including dentists, orthodontists, and periodontists.
- 6213: all health practitioners other than physicians and dentists.
- 621310: chiropractors.
- 621320: optometrists (but not opticians or ophthalmologists).
- 621330: non-physician mental health practitioners, such as clinical psychologists and mental health social workers, but excluding psychiatrists.
- 621340: physical, occupational, and speech therapists and audiologists.
- 62139: other health practitioners, such as acupuncturists, midwives, dieticians, and podiatrists (those holding D.P.M. [doctor of podiatric medicine] degrees).
- 6214: outpatient care centers, such as HMO medical centers, family planning centers, outpatient substance abuse treatment centers, kidney dialysis centers, and community health clinics.
- 6215: diagnostic labs, such as for medical testing and imaging.
- 6216: home health services, such as those providing in-home personal care and visiting nurses.
- 6219: other ambulatory care services, such as ambulance services, blood banks, and smoking cessation programs.
- 623: all nursing and residential care facilities.

- 6231: nursing care facilities, e.g. skilled nursing facilities and inpatient care hospices. This includes assisted living facilities providing primarily full-time nursing care, but excludes establishments providing primarily social and housekeeping support to residents.
- 6232: all residential intellectual and developmental disability care facilities.
- 623210: inpatient facilities for care of individuals with intellectual and developmental disabilities.
- 623220: inpatient facilities providing mental health or substance abuse care.
- 6233: continuing care and assisted living, i.e., retirement communities providing meals, housekeeping, and social activities for residents rather than day-to-day medical care.
- 6239: other residential care facilities, such as group foster homes, group homes for the disabled that do not provide nursing care, and disciplinary camps for delinquent youth.
- 446110: pharmacies and drug stores.
- 446130: optical goods stores, which includes businesses that fit and sell prescription and non-prescription eyeglasses and sunglasses.
- 446199: miscellaneous other health and personal care stores, including those that sell hearing aids, prosthetics, convalescent supplies, and sick room supplies.

Note that NAICS codes are hierarchical, and three- and four-digit codes are inclusive of all six-digit codes that start with the same pattern. For example, if a tract contains three ambulatory health care providers (621), two physicians (6211), and one dentist (6212), the total number of providers is three, not six.

For each NAICS code we identified, we queried the NETS database for all establishments that were open at some time between 2003 and 2015 and in 2017 (NETS does not contain data for 2016), and their location during each year. Note that NETS data were not cleaned or verified during this process, and that NETS data has limitations and inaccuracies as described in Gomez-Lopez et al. (2017) and Finlay et al. (2019).

We determined each establishment's census tract for each year by mapping its latitude and longitude provided in the NETS database to the 2010 version of the TIGER/Line shapefiles from the US Census Bureau.

Using these locations, we created three variables to represent establishment counts per tract. The first count variable is the total of all establishments with that NAICS code in the tract. The second is the count of just establishments with non-zero sales figures in the current year, which can be used where desired to filter out establishments with very low business volume. The third is the count of establishments employing more than one person, which can be used to filter out very small owner-operated businesses if desired. The most useful variable for a given research question may vary by establishment type, so we have created three count types for all NAICS codes so that users may make their own decision about the version that best meets their needs.

We then calculated population densities (per 1000 people) for each of the three count variables for each NAICS code. Tract populations for 2003-2009 come from the NaNDA dataset

[Neighborhood Socioeconomic and Demographic Characteristics of Census Tracts, United States, 2000-2010](#). Values for each year are interpolated. For 2010-2012 and 2013-2017, we used the tract population from the NaNDA dataset [Socioeconomic Status and Demographic Characteristics of Census Tracts, United States, 2008-2017](#). Population figures in this dataset were taken from the 2012 and 2017 ACS five-year estimates, respectively, in order to avoid overlapping ACS estimates as advised by the Census Bureau, and for compatibility with other NaNDA datasets. Population figures for 2010-2017 are not interpolated. Consult the codebooks for the NaNDA datasets Neighborhood Socioeconomic and Demographic Characteristics of Census Tracts, United States, 2000-2010 (Clarke & Melendez, 2019) and Socioeconomic Status and Demographic Characteristics of Census Tracts, United States, 2008-2017 (Melendez et al., 2020) for details on why these population figures were selected and how 2003-2009 population was interpolated.

We also created three variables representing the density of establishments per square mile. The area is the land area of the tract from the 2010 version of the TIGER/Line shapefiles. As a result, all area densities are standardized to 2010 census geography and are comparable across years across the entire dataset.

Population density was set to -1 for tracts with zero population in a given year. Population and area densities are missing for tracts in Puerto Rico and the US Virgin Islands, which are not included in the TIGER/Line shapefiles. Population and area densities are also missing in certain years for a few census tracts whose FIPS codes changed at some point between 2003 and 2017.

Finally, we merged counts and densities of all selected NAICS codes to create an aggregate dataset containing tract population, area, and count and density variables for all health care services per tract.

Variables

For additional information on the definition of each NAICS code, see the Methodology section of this document and the 2017 NAICS website: <https://www.census.gov/cgi-bin/sssd/naics/naicsrch?chart=2017>.
